OBJECTIVE:

Mobility and congestion are challenges for every city. More and more of them are turning to technology to provide better, faster and cheaper ways to get around. Smart transportation systems increase mobility and improve safety for millions of people in an environmentally conscious manner. Smart parking, traffic signals that can adapt to real-time conditions and roads that sense the surrounding environment are becoming more common place. The different contexts - financial, community, land use, transportation, and environmental - determine the design of the solution. Inclusive of context-sensitive solutions, Smart Transportation also encompasses network connectivity, access and corridor management for a better tomorrow. However, this transformation also creates a new set of challenges for transportation agencies, cities, governments, enterprises, service providers and systems integrators who all have increasing pressure to improve safety, mobility and operational efficiency, while reducing environmental impacts and costs all at the same time.

The participants of the program will have an opportunity to interact with the eminent people selected as our resource persons from various institutions, industries and Research & Development organizations.

Workshop covers:

- Role of Urban Transport in Smart Cities: Challenges
- Multi-modal Public Transportation
- e-Mobility
- ITS for Smart Mobility
- Sustainable Transportation Methods
- Pedestrian and Bicycle Facility Design
